

# Development of Technology for Producing Concrete and Cement Using CO<sub>2</sub> (Concrete Field)

(Amount covered by the government: Up to 35.94 billion yen)

- There are high expectations that using CO<sub>2</sub> in concrete by means of Carbon Recycling technology will be implemented in society, as it will make it possible to fixate CO<sub>2</sub> by means of large-scale and long-term use.
- With a view toward social implementation, it will be important to solve challenges such as maximizing volumes of CO<sub>2</sub> emission reduction and CO<sub>2</sub> fixation (\*), expanding applications and reducing costs (material development, manufacturability and workability), and reducing CO<sub>2</sub> emissions in the manufacturing process, all while ensuring safety.
- For this purpose, efforts are to be made toward establishing and standardizing the following: development and combined use of materials for fixating CO<sub>2</sub> (special admixtures, aggregates, etc.), manufacturing and construction techniques to minimize costs, and quality control methods, including evaluation of CO<sub>2</sub> fixation volumes.

<Example of concrete produced with reduced CO<sub>2</sub> emissions and maximized fixation volumes>

[Road blocks]

[Mold frame]

[Pavement blocks]

【Target】 CO<sub>2</sub> reduction of 310-350 kg/m<sup>3</sup> (of which the CO<sub>2</sub> fixation volume is 120-200 kg/m<sup>3</sup>)  
Costs that are less than or equal to those of existing products (Reference figures: Precast concrete = around 30 yen/kg;  
ready mixed concrete = around 8 yen/kg)

# Development of Technology for Producing Concrete and Cement Using CO<sub>2</sub> (Cement Field)

(Amount covered by the government: Up to 20.84 billion yen)

- Cement is made from limestone, clay, and other raw materials. The main raw material, CaCO<sub>3</sub>, inevitably produces CO<sub>2</sub> through a decarbonation reaction.
- Develop a CO<sub>2</sub>-recovering cement production process (\*) that will recover nearly all the CO<sub>2</sub> from limestone, and also develop technology for using the recovered CO<sub>2</sub> as carbonate. [\* The goal is to recover more than 80% of the CO<sub>2</sub> generated in the preheater]

## <CO<sub>2</sub>-recovering cement production process>
